What is Jeen Metadata

Jeen Metadata is a governed data agent that lets anyone in the organization query complex, live databases in plain language. It understands your schemas and business context, translates questions into SQL or source-specific queries, and returns tables, insights and interactive dashboards with traceable sources and existing permissions. No coding, SQL or BI tools: every team gets its own **virtual analyst**.

Text-to-Dashboard. With one follow-up command, the agent builds a complete, governed app around the data: KPIs, maps, routes and charts, ready to explore and share in seconds.

A dashboard generated from one plain-text request

1 Connect Governed Data

Connect data and metadata across operational, ERP, CRM, case-management and BI systems. Jeen maps schemas and context, and keeps existing permissions intact.

2 Ask in Plain Language

GenAI understands intent and schema, then translates each question into SQL or source-specific queries, returning tables, automated insights and suggested follow-ups.

3 See It, Share It

Turn answers into visualizations, dashboards and briefings in seconds, with every number traceable to its source and ready for decision-makers.

EXAMPLE
SUPPLY CHAIN

ASK

"What's in transit right now?
Show 20 results"

ANSWER

Live table of 20 shipments,
insights & follow-ups

ASK AGAIN

"Create a dashboard"

Interactive dashboard:
KPIs, route map, charts

From Trusted Data to Operational Understanding

Most organizations already hold the answers, scattered across systems and locked behind SQL and specialist teams. Jeen Metadata makes fragmented data usable: authorized people reach reliable answers faster, with less dependency on data teams, while governance, auditability and sovereignty stay intact.

Why teams choose Jeen Metadata

Data for Everyone

From executives to field operators: anyone can ask, without SQL, code or BI tools. No more data-team bottleneck.

Speed to Insight

From a plain-text question to a live table, insights and a full dashboard in seconds, not days of tickets and reports.

Governed & Traceable

Existing permissions apply to every query, and every answer links back to its sources under one Jeen governance layer.

Sovereign by Design

Deploy on-premises or fully air-gapped. Sensitive data never leaves your organization's security boundary.

GO FURTHER

Jeen **Perspectives**: Keep Operational Understanding Current

Start from a mission, such as reducing backlogs, spotting emerging patterns or improving readiness. Perspectives investigates what deserves attention across authorized sources, explains what is changing and why, with supporting evidence and remaining uncertainty, and adapts the same facts to each role, including GenAI-built maps, timelines, briefings and simulations.

Metadata helps organizations interrogate their data. **Perspectives** helps them understand what requires attention, why it matters and how the picture is changing.
